

Archimedes Foundation at Stanford

The Problem

Millions of people worldwide do not reap the benefits of our Information Age because they cannot access computers and information appliances owing to limitations associated with:

- Physical and cognitive disabilities
- Aging
- Education
- Literacy

The Result

Any individual can conveniently and affordably use any computer and information appliance, regardless of disability, culture, preference, and resources.

Archimedes at Stanford collaborates with universities and companies worldwide to develop technologies that make information accessible to all people.

The Archimedes Solution

Our Intelligent Total Access System (ITAS) gives people a convenient and affordable means to use existing and future information technology by providing:

- **An Intelligent Accessor** that provides personalized user interfaces
- **An Intelligent Total Access Port (ITAP)** that enables computers and information appliances to work with any accessor.
- **Wireless communication** connecting any accessor to any ITAP.
